

No cell shows the perturbation effect growing with reasoning
 — the 'robust' region (drop < 0) is empty

All point estimates ≥ 0 ; no clean cell's drop is significantly different from 0 — we claim the robust zone is empty, NOT that drops are individually positive (§8.5). daft's CI appears to exclude 0, but truncation makes its high-effort arm a different, easier population — that manufactures the gap (§8.3); daft gestures at the decoupling but cannot establish it.
